

INTRAVENOUS ROBAXIN IN THE MANAGEMENT OF
LOWER EXTREMITY PAIN

This is a procedure for which patients have been hospitalized in treatment of low back and lower extremity pain. Studies carried out have shown that the Intravenous Robaxin is no more effective than Oral Robaxin. The Medical Advisory Board will not support the admission of a patient to the hospital for Intravenous Robaxin and discourages the use of it in light of the above information, either on an inpatient or outpatient basis.
